WHITEPAPER · V2.5 · OCTOBER 2026

World Button / Click

One button. One global game. One digital economy.

CLICK · Solana · Maximum Supply: 1,000,000,000 · Launch: StonkFun Standard Mode · Planned public utility: January 2027 · Click-Powered Buyback & Burn

ABSTRACT

World Button combines CLICK, a digital token on Solana, with WorldClick, a global application for participation and competition. The interaction is deliberately simple: users press a central button and accumulate activity.

That activity will be aggregated by country, organized into seasons and tournaments, and connected to a progressively developing digital economy. CLICK is the external economic layer. WorldClick is the product and game experience.

WorldClick is intended to create recurring individual and national competition. In country competitions, a defined portion of selected funds may be allocated to a charitable organization in the winning country, with the beneficiary selected through DAO voting and the applicable smart-contract rules.

CLICK will be launched through StonkFun Standard Mode. The project does not rely on a traditional presale or ICO and does not introduce a second fungible token at this stage. The maximum supply is 1,000,000,000 CLICK, with allocations for market and liquidity, treasury and development, team, community and ecosystem, impact and philanthropy, and strategic reserve.

V2.5 introduces the Click-Powered Buyback and Burn programme: 50% of net revenue actually received is allocated to buying CLICK on the open market and permanently burning it, and every verified click accumulates toward public burn milestones. The mechanism connects participation directly to supply reduction without promising financial return.

30 Final Statement

1. The Project

World Button starts from an intentionally simple idea: turn the universal gesture of pressing a button into a global experience of participation, competition, identity and impact.

WorldClick is the application layer. Users press the central button, accumulate points, participate in seasons and compete individually and as representatives of their countries. Activity is aggregated by country and can be used to create global rankings and competitions.

CLICK is the external economic layer of the ecosystem. It is a fungible token on Solana with a maximum supply of 1,000,000,000 CLICK. WorldClick remains the product through which users experience the project; CLICK provides access, utility and an external economic layer where appropriate.

2. The CLICK Token

CLICK is the only fungible token in the ecosystem at this stage. The project does not introduce a second fungible token until a concrete product or governance requirement exists that CLICK cannot adequately address.

Solana is the primary blockchain infrastructure for CLICK issuance, transfers and relevant on-chain operations. The maximum planned supply is 1,000,000,000 CLICK. The project does not present the token as a promise of appreciation, guaranteed liquidity or guaranteed financial return.

CLICK may progressively connect the external market with the WorldClick product through access, digital functionality, marketplace use, special competitions and other utilities introduced over time.

3. Token Economics

This whitepaper separates four concepts that should not be treated as interchangeable: token supply, market activity, treasury assets and team compensation.

CLICK will be launched through StonkFun Standard Mode. The initial market determines price through actual buying and selling activity. Treasury resources consist of revenues actually

received by the ecosystem, including applicable creator revenue from the launch and future product revenues.

Tokens allocated to the team or treasury are not equivalent to cash available for operations. Any conversion of CLICK into USDC, SOL, fiat currency or other operational assets will be subject to the project's published treasury policy.

4. StonkFun Standard Mode

CLICK will be launched through StonkFun Standard Mode. The purpose is to provide an open launch and market-based price discovery while establishing a potential initial revenue stream for the treasury, without relying on a traditional public presale or ICO.

The project does not use Reward Mode as its central economic mechanism. It does not intend to finance the team through a permanent transfer tax distributed to token holders.

Creator revenue belongs to the project treasury only when it is actually generated. Trading activity, volume and resulting revenue are not guaranteed.

5. Revenue and Treasury Flywheel

The economic model is based on a simple cycle: activity generates revenue; effective revenue enters the treasury; the treasury finances product development, competition and impact; those activities can support further participation.

A defined share of net revenue is allocated to the Click-Powered Buyback and Burn programme described in section 6; the remainder continues to finance product development, competition, community and impact.

Potential revenue sources include CLICK trading activity where applicable, WorldClick marketplace activity, sponsorships, partnerships and other legitimate ecosystem revenues. Only revenue actually received is treated as treasury income.

Treasury resources may be reinvested in product development, infrastructure, security, user acquisition, competitions, community initiatives and impact programmes according to published policies and available resources.

6. Click-Powered Buyback and Burn

World Button introduces a deflationary mechanism that connects product activity with the external token economy: the Click-Powered Buyback and Burn programme. Following revenue-based buyback-and-burn models, a defined share of net revenue actually received by the ecosystem is used to buy CLICK on the open market and permanently burn it. Adapted to WorldClick, the burn is powered by clicks: every verified click and every in-app purchase accumulates toward public burn milestones.

Funding. Eligible revenue includes creator revenue from the StonkFun launch when actually generated, WorldClick marketplace activity, in-app purchases, sponsorships, partnerships and other legitimate ecosystem revenues. Initially, 50% of net revenue received is allocated to the Buyback and Burn programme; the remaining 50% continues to finance development, competitions, community and impact through the treasury. This allocation is a published treasury policy parameter rather than a contractual commitment, and it may be adjusted through the project's transparency and governance processes with appropriate disclosure.

Execution. Buybacks are executed on the open market at defined intervals, and acquired CLICK is sent to a verifiable burn address with public on-chain proof. Burns are periodic — for example weekly or monthly — rather than per click: high-frequency gameplay remains off-chain, while the burn is the low-frequency, publicly verifiable on-chain settlement of accumulated activity.

Click milestones. A public counter links participation to supply reduction. Verified clicks and in-app purchases accumulate toward milestones; for example, each billion verified clicks may trigger the next burn event from the funds accrued since the previous one. The counter, country-level attribution and the history of burn events are published as part of the product experience and the transparency framework.

Holder alignment. The programme does not distribute revenue directly to holders. Holder benefit arises from reduced supply and from a product whose activity is visibly connected to scarcity, aligning holders with participation rather than passive yield. If a direct holder distribution is ever introduced, it would be weighted by verified activity such as clicks or points, never by passive balance alone.

Limitations. The programme operates only on revenue actually received: periods without material revenue produce no buyback and no burn. Execution depends on market liquidity, and burning reduces supply without guaranteeing any particular price outcome. The mechanism is not a dividend, a buyback promise or a guarantee of appreciation.

7. Tokenomics

The maximum supply is 1,000,000,000 CLICK.

The Click-Powered Buyback and Burn programme can reduce circulating supply below the maximum over time. Burned tokens are permanently removed from circulation and are not re-minted.

55% — Market & Liquidity: 550,000,000 CLICK for the market launch, liquidity and the broader market ecosystem.

10% — Treasury & Development: 100,000,000 CLICK reserved for long-term development and operations.

10% — Team: 100,000,000 CLICK allocated as long-term participation for the founder and future team members, subject to vesting.

10% — Community & Ecosystem: 100,000,000 CLICK for community growth, partnerships, campaigns and ecosystem initiatives.

10% — Impact & Philanthropy: 100,000,000 CLICK reserved for impact and philanthropic initiatives, subject to defined rules and transparency.

5% — Strategic Reserve: 50,000,000 CLICK reserved for future strategic requirements.

The allocation percentages describe the maximum planned supply allocation. They do not represent cash balances or guaranteed future spending.

8. Team and Vesting

The Team allocation represents long-term participation in the success of the ecosystem rather than an immediate salary or automatic source of cash.

The proposed vesting structure is 36 months, with a 12-month cliff followed by linear monthly vesting. The final allocation between the founder and future team members will be documented through identifiable wallets and vesting agreements before the tokens become materially relevant to the market.

Team tokens remain subject to the applicable vesting terms and are intended to align long-term incentives with the development of World Button.

9. Treasury and Development

The Treasury & Development allocation establishes an explicit on-chain reserve for product evolution. Reserved tokens must not be confused with immediately available operating cash.

Potential uses include WorldClick development, backend services, accounts and authentication, wallet verification, anti-bot systems, interfaces, marketplace infrastructure, servers, databases, APIs, monitoring, blockchain services, security and other operational requirements.

Conversions of treasury-held CLICK into USDC, SOL, fiat currency or other assets may be made when operationally necessary and will follow the project's published treasury policy.

10. Community and Ecosystem

Ten percent of the maximum supply is reserved for community and ecosystem development.

Potential uses include user acquisition, referrals, ambassadors, campaigns, competitions, seasons, community activations, partnerships, developer or creator initiatives and experiences that increase real use of WorldClick.

Community distributions will be conducted in a controlled and transparent manner. No community allocation constitutes a guarantee of market value.

11. Impact and Philanthropy

Ten percent of the maximum supply is reserved for impact and philanthropic initiatives. The objective is to establish a verifiable connection between community scale and social benefit without presenting the allocation as a fixed monetary promise.

In addition to the impact reserve, selected competitions and other ecosystem revenues may contribute to charitable activity.

For country competitions, a defined portion of the relevant prize or impact pool may be allocated to a charitable organization in the winning country. The beneficiary may be selected by DAO vote, with the decision executed through a smart contract according to the governance rules established for the competition.

The project intends to publish verifiable information about material impact initiatives, beneficiaries and relevant fund movements where appropriate.

12. WorldClick

WorldClick is the application that turns the World Button concept into a global participation and competition experience.

Users press the central button and accumulate points according to the rules of the game. Activity is aggregated by country for national and global rankings. Seasons and tournaments create recurring cycles of competition and participation.

The high-frequency game state is expected to remain primarily off-chain. Blockchain infrastructure is used where it adds meaningful value rather than turning every click into a blockchain transaction.

13. Competition and Tournaments

WorldClick may organize weekly and seasonal competitions with individual and national rankings and prize pools defined before each competition.

Weekly tournaments may distribute a defined portion of the relevant prize pool among winners according to published rules. Individual activity contributes to the aggregated score of the user's country.

A predefined impact share of selected tournaments may be directed to charitable activity, including organizations in the winning country selected through the applicable DAO process and smart-contract rules.

14. Access and Holder Utility

From January 2027, CLICK is planned to integrate with WorldClick. Wallet verification may be used to unlock specific functionality where ownership of CLICK is an explicit requirement.

A compatible wallet may be associated with a user account to verify ownership when required. The system will not request private keys or seed phrases.

No second fungible token is planned for basic access or for the principal WorldClick economy at this stage.

15. CLICK Utility

CLICK is intended to acquire utility progressively inside the ecosystem without that utility being presented as a guarantee of appreciation.

Potential utilities include access to features or experiences, acquisition or unlocking of digital game elements, marketplace transactions for selected digital elements, premium competition, special tournaments and future ecosystem functions.

Additional utilities may be introduced as the product develops. Each material utility should be documented before being presented as available functionality.

16. One External Economy and One Game Economy

The project maintains a clear separation between the external token economy and the high-frequency internal state of the game.

The external economy consists of CLICK on Solana, its market, treasury operations, holder utility and potential marketplace integration.

The internal WorldClick economy consists of clicks, points, country scores, seasons, rankings, skills, extras and competition state. Keeping these layers separate allows the game to scale without requiring every user action to become an on-chain transaction.

The Click-Powered Buyback and Burn programme is the bridge between the two economies: high-frequency clicks are aggregated off-chain, generate revenue, and result in low-frequency, publicly verifiable on-chain burns.

17. Marketplace

WorldClick may incorporate an internal marketplace for digital elements. The marketplace is an extension of the product and is not presented as a guarantee of financial liquidity.

Potential categories include functional skills, special extras, cosmetic or other digital assets and access-related elements, subject to the rules of the game.

The final economic structure, fees, royalties, custody model and any on-chain components will be defined before marketplace functionality is launched.

18. Technology

The architecture combines blockchain infrastructure with conventional application infrastructure. Blockchain is used where it adds meaningful value rather than being imposed on every interaction.

Solana handles CLICK and relevant on-chain operations. The application layer includes Android, APIs, accounts, databases, authentication and backend services. The game layer handles clicks, scores, rankings, anti-bot controls, seasons and competition state.

The scalability of WorldClick depends on separating high-frequency gameplay from the comparatively low-frequency blockchain operations that require public verification or settlement.

19. Security

Security is treated as a requirement across every layer of the ecosystem.

Anti-bot measures may include rate limiting, device and account controls, anomaly detection and server-side validation. Wallet operations will use address verification and monitoring of relevant transactions. Backend systems will validate game state and protect score integrity.

World Button will never request private keys or seed phrases. Any request for such information made in the name of World Button should be treated as suspicious.

20. Treasury Operations

The treasury connects economic activity with the project's ability to finance product development, operations, competitions and impact initiatives.

Potential sources include creator revenue from StonkFun when actually generated, marketplace revenues, sponsorships, partnerships and other legitimate ecosystem revenues.

Potential uses include development, infrastructure, salaries and contractors, marketing, legal and compliance work, tournaments, community initiatives, impact programmes and other approved operating expenses.

The buyback allocation is a defined use of treasury revenue under the Click-Powered Buyback and Burn programme. Buyback execution wallets, acquired amounts and burn transactions are intended to be publicly verifiable on-chain.

Treasury wallets are intended to be identifiable and, where practical, publicly verifiable. Material treasury movements should be disclosed according to the project's transparency policy.

21. Governance

Governance will not initially require a second token. The project begins founder-led and may evolve toward participatory mechanisms as the community and decision-making requirements mature.

There is no separate governance token at this stage. Holding CLICK does not automatically grant corporate voting rights.

Future governance may use community consultation, voting, locked or staked CLICK, participation-based mechanisms, reputation or a hybrid model. Any such mechanism should be defined according to the actual decisions it is intended to govern.

22. Social Impact

Social impact is intended to be an operational layer of the project rather than only a marketing statement.

Aggregating participation by country creates a social framework in which community scale can be connected to measurable initiatives. Selected competition funds and other ecosystem revenues may support charitable organizations and projects.

For material initiatives, the project intends to publish information that allows the community to understand the beneficiary, the relevant decision process and the movement of funds, subject to legal and privacy constraints.

23. No Presale or ICO

The project does not contemplate a traditional public presale or ICO, nor a homepage designed as a direct primary-sale mechanism to the public.

CLICK will be launched through StonkFun Standard Mode, allowing price discovery through actual market activity.

The bootstrap strategy is to minimize the founder's initial personal capital requirement and build treasury resources progressively through effective revenues, product activity, partnerships, sponsorships and strategic financing where appropriate.

24. Regulatory Position

World Button does not assign a universal regulatory classification to CLICK in advance. The applicable analysis depends on the final structure, jurisdictions, activities actually performed and characteristics of the token and services.

The applicability of MiCA and other regulatory frameworks must be assessed before activities that may trigger specific obligations. Legal structure, disclosures, consumer protection, AML-related requirements and other obligations will be reviewed as the project approaches launch and expansion.

CLICK is not presented as a share, equity interest, bond, deposit or ownership instrument in World Button.

25. Taxation

Tax consequences depend on the user's residence, jurisdiction, activity and the nature of each transaction.

World Button does not provide individualized tax advice. Each user is responsible for determining applicable obligations relating to acquisition, sale, exchange, rewards, digital activities, gains and losses and conversion into fiat currency.

26. Risks

CLICK and WorldClick involve significant risks and uncertainty. The existence of a product or token does not eliminate financial, technological, regulatory or operational risk.

Market and liquidity risk includes extreme price volatility and limited liquidity, with the possibility of partial or total loss of capital. Technology risk includes smart contracts, wallets, APIs, backend systems and off-chain infrastructure failing, being attacked or becoming unavailable.

Regulatory risk includes changes in laws, classifications and platform requirements. Operational risk includes delays, insufficient funding, dependency on third-party services, security incidents and changes to product scope.

Users should not acquire CLICK on the assumption that the project will generate a profit, maintain a particular price or provide guaranteed liquidity.

The Buyback and Burn programme depends on revenue actually received: periods without material revenue produce no buyback and no burn. Execution depends on available liquidity, and a reduction in supply does not guarantee price appreciation or any financial return.

27. Roadmap

The roadmap represents development objectives and does not constitute a contractual promise of dates.

Q3–Q4 2026: preparation of CLICK, Standard launch, wallets, treasury structure, transparency framework and operational infrastructure.

Q4 2026: development of WorldClick, scoring, rankings, countries, anti-bot systems and season architecture.

January 2027: planned Android application launch and practical integration of CLICK with WorldClick.

Q1 2027: intended implementation of the Click-Powered Buyback and Burn programme, including the public burn counter, milestone structure and burn-event reporting.

2027 onward: expansion of the ecosystem, marketplace, tournaments, partnerships, impact initiatives and governance mechanisms as the product and community mature.

28. Transparency Commitments

Transparency is a structural part of the project, particularly because treasury and team allocations have economic relevance.

On-chain information is expected to include the final mint address, official treasury wallets, team wallets, relevant allocations, material movements and vesting information once finalized.

Off-chain transparency includes product updates, material changes, roadmap progress, WorldClick development, impact reporting and significant economic decisions.

The project intends to provide a public dashboard or equivalent reporting mechanism as the infrastructure matures.

29. Team

World Button begins as a founder-led project. The initial priority is to build a small and efficient team before expanding the organization.

The founder is initially responsible for product direction, architecture and execution. Developers and other contributors may be engaged progressively as treasury resources or strategic financing allow.

Materially relevant team roles, identities, wallets and responsibilities are intended to be disclosed as the organization develops, subject to applicable legal and security considerations.

30. Final Statement

World Button proposes a deliberately simple idea: a button that can become a global activity.

CLICK provides the economic layer. WorldClick provides the experience. Users provide the activity, and through the Click-Powered Buyback and Burn programme that activity can permanently reduce supply. The treasury converts effective revenues into execution capacity. The community can turn scale into competition and measurable impact.

The project does not guarantee financial value, profitability, liquidity, revenue distribution or future success. Its development depends on execution, user participation, market conditions, regulatory requirements and the ability to build sustainable sources of revenue.

Appendix A · Token Allocation

Maximum supply: 1,000,000,000 CLICK.

Market & Liquidity — 55% — 550,000,000 CLICK

Treasury & Development — 10% — 100,000,000 CLICK

Team — 10% — 100,000,000 CLICK

Community & Ecosystem — 10% — 100,000,000 CLICK

Impact & Philanthropy — 10% — 100,000,000 CLICK

Strategic Reserve — 5% — 50,000,000 CLICK

Appendix B · Economic Flow

CLICK → Market → Treasury → Product / Competition / Impact → Community activity. Net revenue is additionally allocated to the Click-Powered Buyback and Burn programme: Buyback → Burn → reduced supply, with every verified click accumulating toward public burn milestones. WorldClick activity may generate product revenues through marketplace, sponsorships, partnerships and other legitimate sources. These flows describe the intended architecture and do not constitute guarantees of trading volume, profitability or revenue.

Appendix C · Items to Be Finalized

Before the relevant phases of the project, the final mint address, official wallets, definitive allocation records, vesting agreements, legal structure, regulatory review, WorldClick scoring rules, competition rules, marketplace model and governance procedures will be finalized and published as applicable.

IMPORTANT NOTICE

This document describes the status, design and intended objectives of World Button / CLICK as of October 2026. References to future functionality, treasury revenues, marketplace activity, competitions, impact, governance or utility describe intended design unless expressly stated otherwise.

Nothing in this document constitutes financial, legal or tax advice. CLICK does not represent a guaranteed investment, security, equity interest, deposit, loan, or promise of profit. Users are responsible for evaluating the risks and legal and tax consequences applicable to them.
